Taras Kloba, Kyrylo Prykhno, PGConf 2022

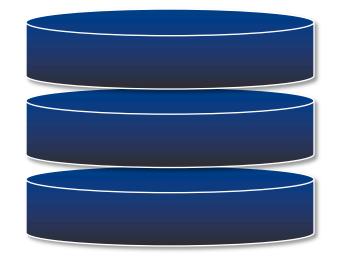

INTRO

Our customers want to modernize from their legacy proprietary databases ...

#### to standardize on open source

Cloud offers organizations **agility**, **cost savings**, and **differentiated capabilities**.

That's why **75% of all databases** are expected to be in the cloud this year.

## ALLOYDE FOR POSTGRESQL

## ALLOYDE HIERARCHICAL STRUCTURE

- A **cluster** contains all the resources for a PostgreSQL deployment.
- A **primary instance** provides the read/write connection point for the databases in a cluster. Every cluster has one primary instance.

soft**serve** 

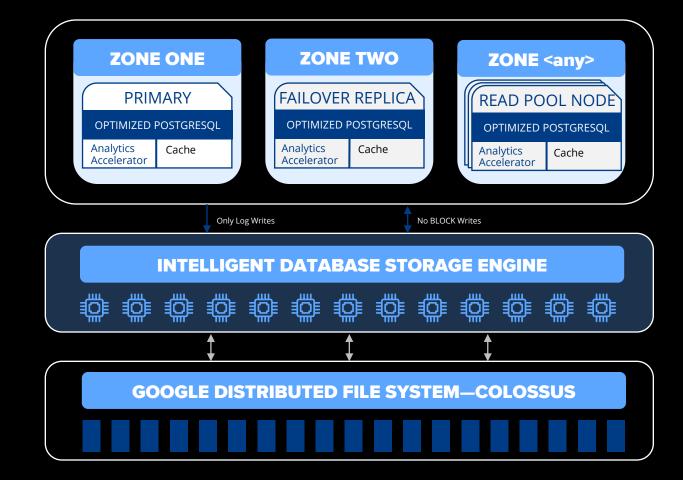

• A **read pool** instance provides a read connection point for database data in a cluster.

## ALLOYDE ARCHITECTURE

#### INTELLIGENT DATABASE STORAGE DESIGNED AND OPTIMIZED FOR POSTGRESQL

Powers fast, predictable performance by eliminating I/O bottlenecks and offloading to storage service.

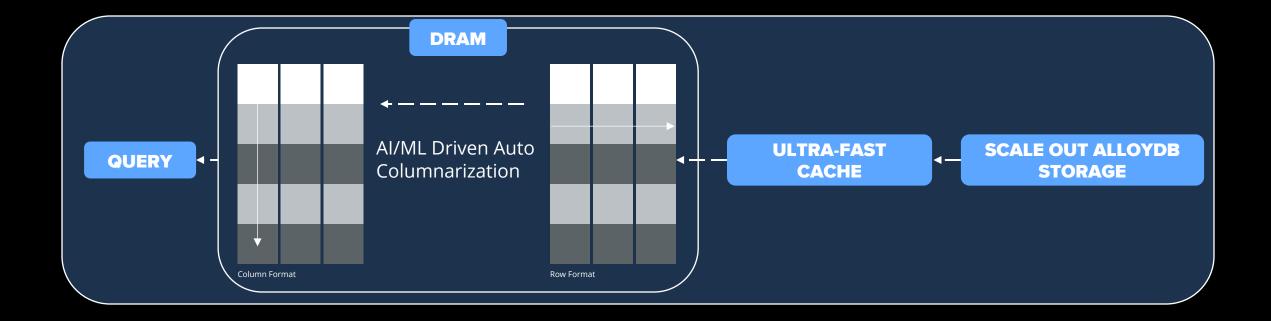

Regional storage improves cluster availability with fast, bounded failover and enables lowlag-to-read replicas.

## ALLOYDE ARCHITECTURE

#### FAST AND PREDICTABLE PERFORMANCE

Intelligent, workload-aware dynamic data organization leverages both row-based and column-based formats. Format layers of cache ensure excellent price-performance.

## ADDITIONAL FEATURES

#### EASY TO MANAGE

- Automatic vacuum management
- Automatic memory management
- Automatic storage tiering
- Automatic data columnarization and query rewrite

#### FULLY POSTGRESQL COMPATIBLE

- Fully compatible with PostgreSQL 14
- Over 175 flags supported
- Over 50 extensions supported
- Move your existing PostgreSQL application as-is, with no code changes

#### PREDICTABLE AND TRANSPARENT PRICING

- No licensing or opaque I/0 charges
- Great price-performance
- Right-size instance when needed
- Pay-for-what-you-use storage

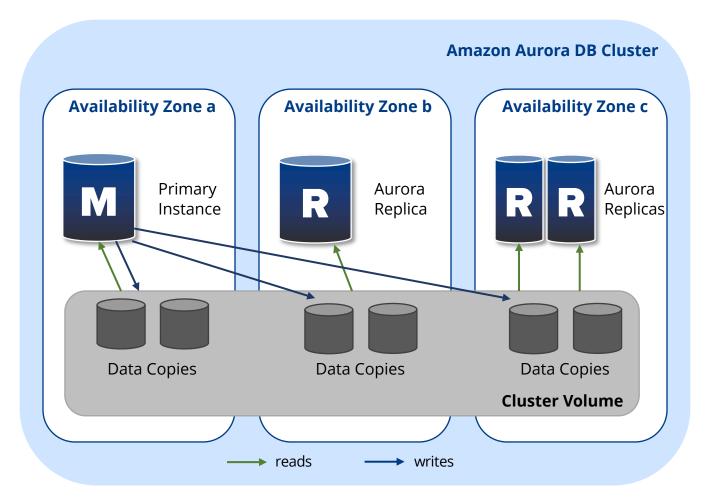

## **DAWS AURORA**

### AMAZON AURORA BASIC ARCHITECTURE

Amazon Aurora is a cloud-based relational database engine that combines the speed and reliability of high-end commercial databases with the simplicity and cost-effectiveness of opensource databases. Basically, they have taken PostgreSQL and MySQL and replaced the storage layer with a proprietary layer that allows it to be distributed.

## AMAZON AURORA DB CLUSTER

#### **PRIMARY DB INSTANCE**

Supports read and write operations and performs the data modifications to the cluster volume. Each Aurora DB cluster has one primary DB instance.

#### **AURORA REPLICA**

Connects to the same storage volume as the primary DB instance and supports only read operations. Each Aurora DB cluster can have up to 15 Aurora Replicas in addition to the primary DB instance.

## **BASIC ARCHITECTURE**

#### WRITE NODE

A single node or endpoint that makes all write requests for the database.

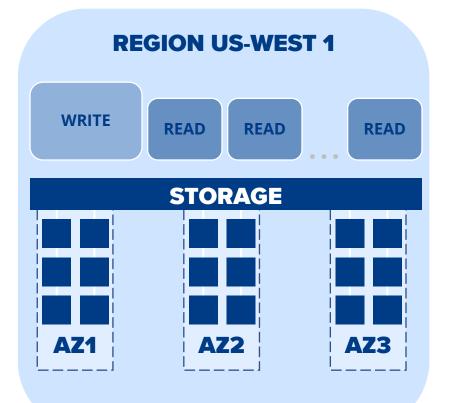

#### **READ NODES**

Multiple read-only endpoints to meet your read throughput requirements, typically deployed across multiple AZs.

#### **STORAGE LAYER**

A collection of machines with SSD spread across multiple AZs. Data is written here six times.

The trick is ... everything is decoupled instead of writing locally to attached persistent storage, it writes to this custom, distributed storage layer.

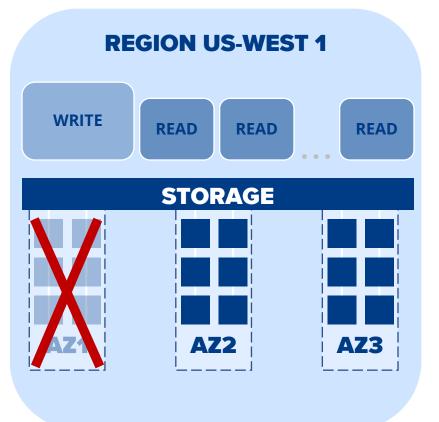

## **BASIC ARCHITECTURE**

#### **AURORA: 4 OF 6 QUORUM WRITES**

The storage layer will commit a transaction when four of six copies are written.

They do this so that the database can survive the loss of an availability zone. If two copies were in an AZ, the data can still have four copies.

Reads are guaranteed when three writes are written.

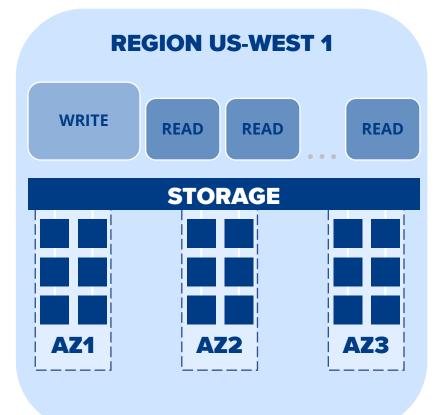

## **BASIC ARCHITECTURE**

#### **SCALE (FOR READS IN A SINGLE REGION)**

In order to scale Aurora, you simply add more instances on top of the shared storage, and they all have immediate access to all data written to the disk.

#### **RESILIENCE (FOR READS IN A SINGLE REGION)**

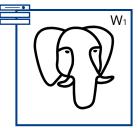

If a read node fails, it can just be recycled, and all queries can just be directed to other instances while it recovers.

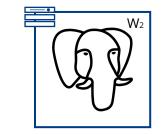

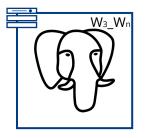

## AZURE DATABASE FOR POSTGRESQL-HYPERSCALE (CITUS) IS **NOW AZURE COSMOS** DB FOR POSTGRESQL

Oct 12, 2022

WORKER NODES

A Citus cluster consists of multiple PostgreSQL servers with the Citus extension.

COORDINATOR

NODE

soft**serve** 

Distributed Postgres: How to build a multi-tenant SaaS app with Citus

APPLICATION

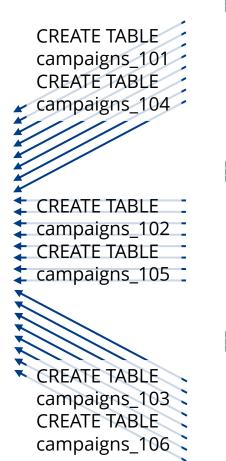

#### HOW CITUS DISTRIBUTES QUERIES ACROSS THE DATABASE CLUSTER CRETTER

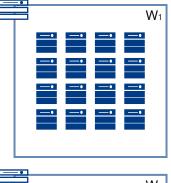

#### APPLICATION

CREATE TABLE campaigns (...); SELECT create\_distributed\_table( 'campaigns', 'company\_id');

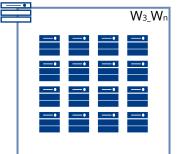

AZURE COSMOS DB FOR POSTGRESQL

			W2	2

•	•	•	•	
•	•	•	•	
•	•	•	•••	

## HOW CITUS DISTRIBUTES TRANSCATIONS IN A MULTI-NODE CLUSTER

#### APPLICATION

COORDINATOR NODE

callbacks:

- pre-commit
- post-commit
- abort

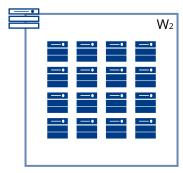

BEGIN ... assign\_distributed\_ transaction\_id ... UPDATE campaigns\_203 ... PREPARE TRANSACTION... COMMIT PREPARED...

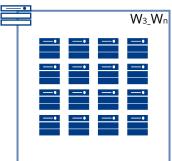

transaction\_id ...

COMMIT PREPARED...

UPDATE campaigns\_102 ... PREPARE TRANSACTION...

### ALL THE FUNCTIONS OF POSTGRES AVAILABLE TO CITUS CLUSTER

- JSONB
- Joins
- Functions
- Constrains
- Indexes:
  - B-tree
  - Gin
  - Brin
  - Gist
- Partial indexes
- Other extensions

- Rich datatypes
- Foreign data wrappers
- Window functions
- CTEs
- Full text search
- pg\_stat\_statements

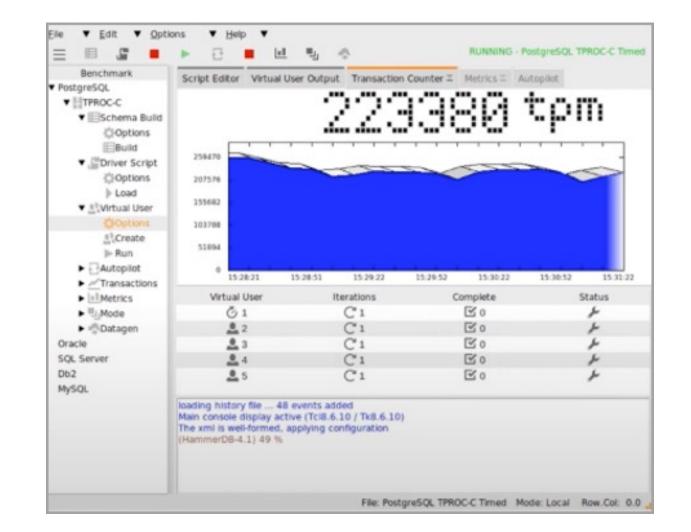

## BENCHMARKING

## MY MAIN ADVICE WHEN RUNNING PERFORMANCE BENCHMARKS FOR POSTGRES IS: "AUTOMATE IT!"

Jelte Fennema

## WHAT IS HAMMERDB?

- Not a database!
- Leading open-source tool for benchmarking relational databases
- Interfaces:
  - Graphical
  - Command Line
  - Web REST interfaces
- Industry standard benchmarks
- High performance and scalability

## **TPC OPEN SOURCE**

- Hosted by TPC Council since 2019
  - Industry standard body for database benchmarks
- TPC-OSS subcommittee
  - Oversees and approves changes
- V4.1 Released on April 22, 2021
- Source code on GitHub
- Binaries @ GitHub Releases
  - https://www.hammerdb.com/download.html
- Client natively supports Linus and Windows on x64
  - GUI & CLI on both Linux and Windows
- GitHub Release Downloads
  - https://www.hammerdb.com/stats.html
- Test databases on any platform

## **SUPPORTED WORKLOADS**

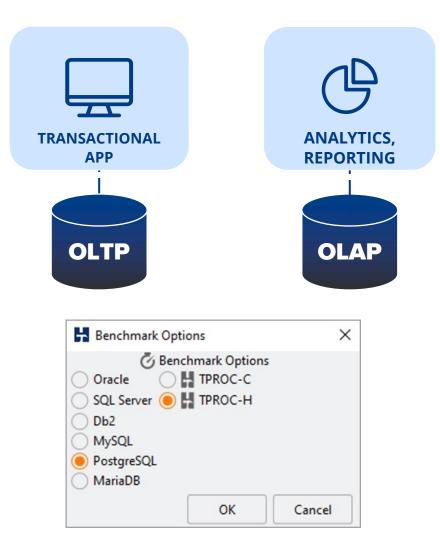

#### **TPROC-C = OLTP**

- Transactional workloads. Row oriented, high read and write throughput
- Derived from TPC-C

#### **TPROC-H = OLAP**

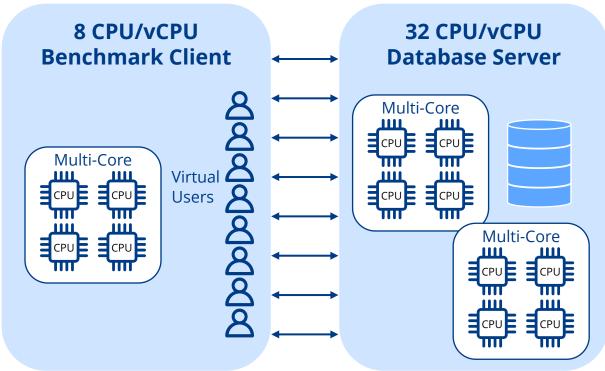

- Analytic, Decision Support
- Focus on ETL
- High bandwith reads and minimal writes
- Derived from TPC-H

Using TPCC/TPC-C, TPCH/TPC-H for derives workloads not permitted (trademark violation)

# **KEY DATABASE BENCHMARKING CONCEPTS**

- Parallel benchmarking software
  - Concurrency control must be in database, not in client
- Complex workloads designed to scale and test RDBMS concepts
  - Locking and latching
- Cross reference workloads across multiple database engines
  - Validate concepts
- HammerDB up to 6-7 NOPM on commercial database engines on two socket servers
  - High confidence levels that bottlenecks are in database software not HammerDB

## **SCHEMA BUILD CHOICES**

#### **SCHEMA BUILD**

- Creates tables
- Creates and loads data
- Creates Indexes
- Creates functions/stored procedures
- Gathers statistics

#### NUMBER OF WAREHOUSES

- Define according to system scale
- Entire schema scaled based on warehouse count

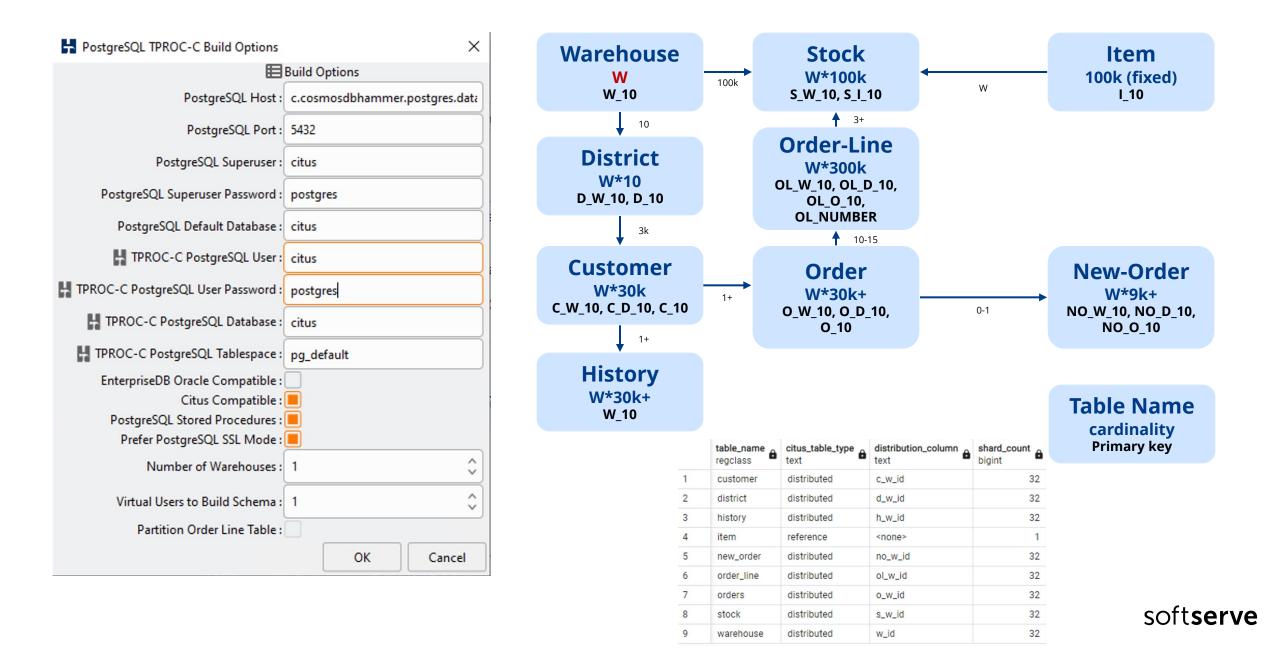

#### **STORE PROCEDURES**

- New Order
- Payment
- Delivery
- Stock Level
- Order Status

#### VIRTUAL USERS TO BUILD SCHEMA

- Schema creates and loads data in parallels
- Use number of CPU cores/threads on HammerDB client

## **SCHEMA BUILD CHOICES**

## UNDERSTANDING RESULTS: NOPM vs TPM

Vuser 1: Test complete, Taking end Transactional Count.Vuser 1: 140 Active Virtual Users configuratedVuser 1: TEST RESULT : System achieves 1722391 NOPM from 5216947 PostreSQL TPM

#### NOPM

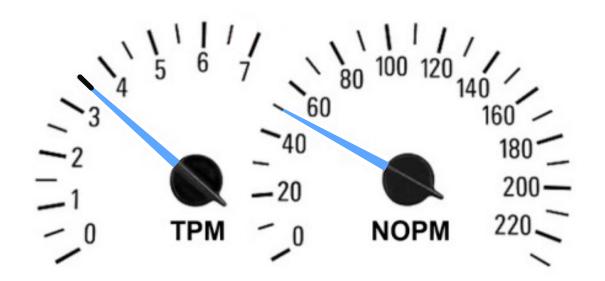

- How fast you are going
- Close relation to official tpmC

#### ТРМ

• How hard your engine is working

#### **COMPARING PERFORMANCE**

- NOPM can be compared between engines
- TPM can only be compared across the same engine
- TPM useful engineering metric to compare statistics

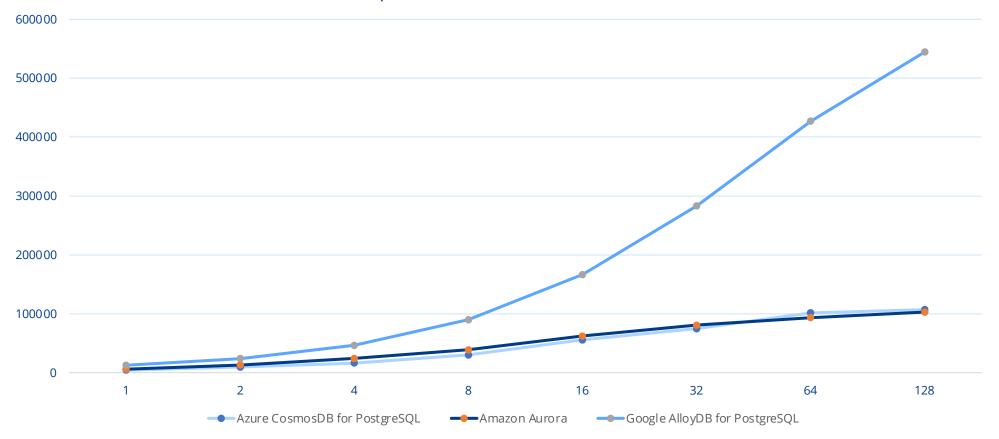

## TABLE WITH COMPARISON

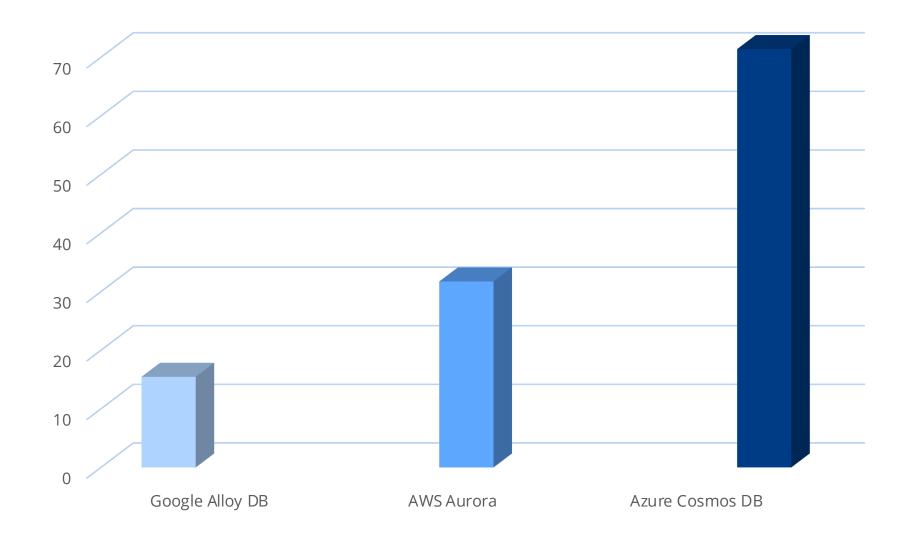

LIMITS	GCP ALLOYDB	AWS AURORA	AZURE COSMOSDB FOR POSTGRESQL
Max database storage per cluster	5 TiB	128 TiB	2 TiB per worker nodes (max 40 Tib)*
Max read pool nodes/workers per cluster	20 (15 if all nodes are of the 64 vCPU machine type)	Up to 15 Aurora Replicas in addition to the primary DB instance	Up to 20 workers
Maximum concurrent connections	Up to 240'000	Up to 16'000	Up to 2'000*

## **TPC-H PROCESS**

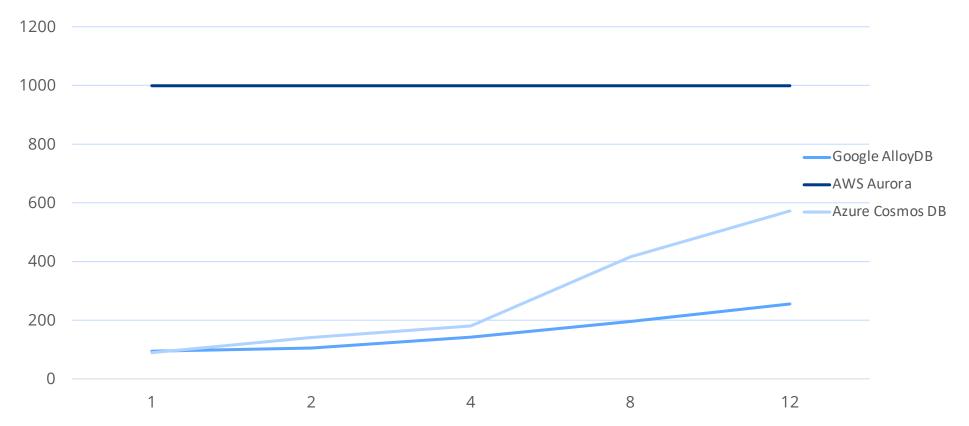

## LOAD & INDEX DATA TEST

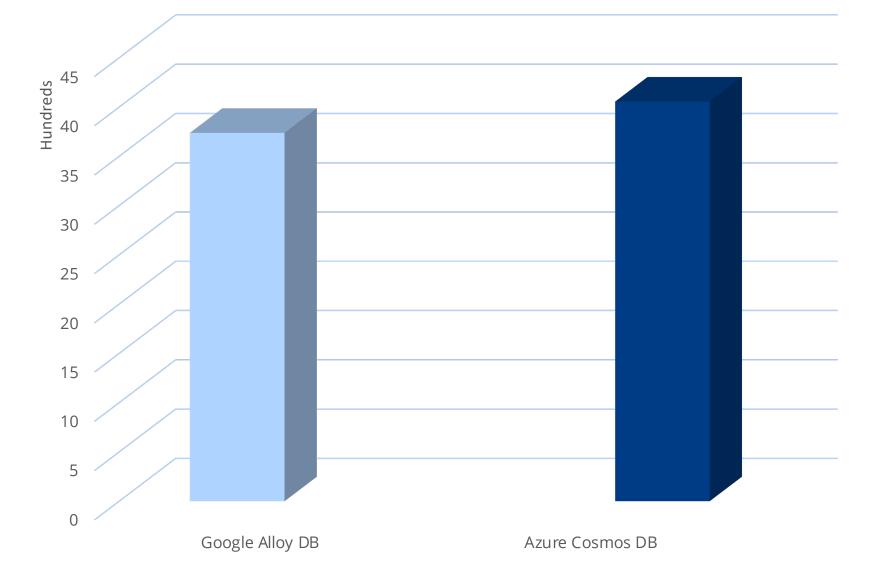

### OLAP TESTING (TPROC-H DERIVED FROM TPC-H)

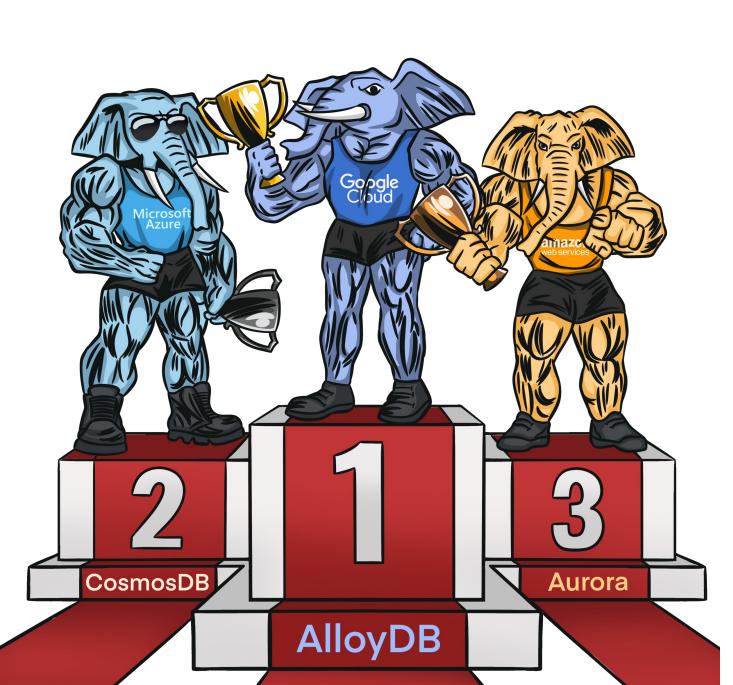

The lower—the better.

### PRICE/PERFORMANCE RESULTS (PRICE/QPHH)

## SUMMARY

- Run PoC(s) to get practical experience and build confidence
- Do full-scale architectural exercises, with "How do I do X?" questions instead of "Can I do X?"
- Try to approach cloud vendors for the best pricing offer
